Upper estuary zone of Eprapah Creek at low tide (Left) and high tide (Right) during king tide conditions - View from the right bank at Site 3 looking downstream on 2 February 2010
1. Presentation

The purpose of the field work is to introduce undergraduate students to the complexity of an unsteady waterway: i.e., an estuarine system, together with the difficulties associated with field experiments and the interactions between hydraulic engineering, water quality, biology and ecology. The students will (1) survey the creek cross-sections, (2) monitor the water quality and hydraulics in the estuary of a small creek, as well as the bird and fish habitats during the same period, and (3) perform some numerical modelling of the creek estuarine zone. They will process and analyse their data, and compare these with the theory (CIVL3140, CIVL4110, CIVL4120 & CIVL4140). The assignment will highlight practical details which must be considered during the study of a system: e.g., tidal effects, ecological issues, public access, impact of a sewage plant. The creek system is located in the Redlands shire close to Brisbane QLD (Table 1-1, Fig. 1-1 & 1-2).

This field work will be some group work to emphasise team work, collaborative efforts and communication. A total of 2-3 sites will be considered within the estuarine zone (Table 1-1, App. III). Each site will be surveyed, analysed and investigated continuously by a group of 6-10 students from Monday 3 September 2012 (6:00am) to Monday 3 September 2012 (6:00pm). The project will be concluded by an oral presentation on Tuesday 18 September 2012 and a report submission on 20 August 2012 (Table 1-2). The oral presentations will be assessed by both lecturer and peers.

2. Field works

2.1 Field works

The field works will take place on Monday 3 September 2012 (6:00am) to Monday 3 September 2012 (6:00pm). Measurements shall be conducted from a low tide to the low tide on the next day: i.e., between 6:00am and 6:00pm to make use of the daylight for setting up and dismantling each sampling site (Tables 2-1, 2-2, 2-3 & 2-4). Some readings will be taken every 15-20 minutes while others may be taken every 30 minutes or every hour possibly (see below, Table 2-3).

Related informations:

Prof. Hubert CHANSON, a number of Civil Engineering School staff and a number of volunteers will be in the Eprapah catchment on Monday 3 September 2012 (6:00am) to Monday 3 September 2012 (6:00pm). They will circulate among groups to provide advice. A headquarter will be based in the Mungara building, Landcare Group, Eprapah Environmental Training Centre (corner of Colburn Ave and Cleveland-Redland Bay Rd, Victoria Point). A safety officer will be on site with a first-aid kit from Monday 3 September 2012 (6:00am) to Monday 3 September 2012 (6:00pm), and he will be contactable by phone (see paragraph 2.5).

Field equipments (see Table 2-2) will be available from Mr Jason VAN DER GEVEL (UQ-CE Hydraulic Lab.) between Tuesday 21 August 2012 and Tuesday 28 August 2010 between 10:00am and 3:00 pm. ALL the equipments must be returned un-damaged and cleaned no later than Monday 10 September 2012 before 3:00pm to Mr Jason VAN DER GEVEL (Hydraulic Lab.). (Lateness in returning the equipment and damage to any equipment shall be heavily penalised.)

Note that some equipment was kindly lent by other departments and institutions. It must be returned undamaged.

PLEASE clean all equipment before returning all the gears undamaged.

Further the field works will be conducted in Conservation Parks and Environmental Centre. Students are requested to take great care to the environment during the field works. (All refuse, waste and litter generated by the activity MUST BE REMOVED from the reserve areas.) Any damage attributable to the use of the reserves shall be heavily penalised.

### 2.2 Field measurements

Each group will conduct a series of hydraulic, water quality and ecological measurements **with the first reading at 6:00am and the last reading at 6:00pm**. Some readings will be taken every 20 minutes while others will be taken at longer intervals (Table 2-3).

In addition, students may keep an eye open with regards to **special features** like saltwater/freshwater fronts, water level surges, boat passages, bird fishing activities, surface slicks, pollution runoff, ... and record these details (incl. photographs). Interesting flow features might also occur around high/low tide slack ...

**Students should further record atmospheric events including air temperature, rainfall (time, amount), sun light conditions, wind, wind waves ...**

Further you are encouraged to observe and document aquatic plants, benthic vertebrate and invertebrate fauna. These would be reported in your report.

</tbody>
</table>

Practical considerations

ALL THE DATA shall be recorded in writing. These data will constitute a key component of the final report and of the groupwork assessment. Students are very strongly encouraged to think beforehand how they will record the data and to prepare relevant books and notepads. Any loss of field data is not acceptable. Use carbon copies (e.g. accounting books) to backup your data regularly.

Field observations will include some hydraulic, environmental and ecological measurements.

Hydraulics measurements will include (1) the surface velocity by timing suitable floats over a known distance, and (2) the water level using a pole with graduations from where the reading is taken. Importantly, the flow direction shall be carefully recorded and unusual flow patterns at slacks shall be recorded.

Water quality measurements will include (1) air and water temperatures, (2) water conductivity, (3) pH, (4) turbidity, (5) dissolved oxygen concentrations.

Ecological observations will include (1) fish habitat and behaviour observations using fish trap and net, (2) bird survey from a fixed point and (3) wildlife/fauna observations from a fixed point as well as in the surroundings of the group site.
The freshwater runoff flow shall be estimated on the day at the Redland Bay/Cleveland Road bridge. This flow will be an input for the numerical modelling works.

SURVEYING
The channel cross-section shall be surveyed at low tide, preferably a couple days prior to the field work (Table 2-4). Sites for the surveys are listed in Table 2-4. The survey shall be conducted during day time and at low tide for safety. In deep water regions, students could consider the use of boat or surfboard.

During the survey of the cross-section, ensure that the survey is conducted perpendicular to the main flow direction.

Record the bed material at each sampling point, as well as the water depth and time (within the minute) of each sampling location.

FISH OBSERVATIONS
- Sites of fish trap and dip net must be changed regularly. Ideally, they must be placed at different types of cover and flow conditions. There are 4 basic combinations:

<table>
<thead>
<tr>
<th>Vegetation cover</th>
<th>Main flow (Fast)</th>
</tr>
</thead>
<tbody>
<tr>
<td>No cover</td>
<td>Recirculation zones (Slow)</td>
</tr>
</tbody>
</table>

Conduct the observations by rotating the sampling sites between 8 locations (i.e. not re-using a site within 2 hours). Each site must be at least 8-12 m away from the previous one.

- Vegetation cover and zones of flow recirculation are very important parameters affecting fish behaviour. Draw maps of instream habitat and micro-vegetation for low tide and high tide.

- Fish trap (bait trap) must be oriented toward the incoming flow. Fish bait is typically cat food (e.g. GoCat, dry bait, prawn flavour). It must be renewed every time.

- Fish net (dip net) are pushed ahead of you, inclined about 60 degrees and close to the bottom. A fish net pass is typically 3 m long (pushing the fish net in front of you).

- Combined use of bait trap and dip net: use bait rap first, then conduct dip netting at that site.

- When handling fish, use wet disposable gloves (e.g. latex gloves) to hold the fish to avoid damaging their mucus. Fish mucus are very sensitive and dry skin may damage these.

- Exotic fish must not be released into the stream system. Place these in a bucket with few drops of clove oil to put these asleep. Later freeze them to kill them.

NOTES
- Before each water quality reading, rinse once the bucket with creek waters before collecting the water samples.
- Collect water samples about 20 cm beneath the free-surface.
- Each series of measurements conducted every 20 minutes must be reported on a water quality survey form (App. IV).
- Each series of fish observations conducted every 30 minutes must be reported on a fish habitat/behaviour survey form (App. IV).
- For fish habitat and behaviour observations, each group is strongly advised to have the reference book ALLEN et al. (2002) [12].
- Constant monitoring of birds and wildlife must be reported on a bird/wildlife survey form (App. IV).
- For bird observations, each group is strongly advised to have a solid reference book (e.g. [8] SIMPSON et al. 1999; [9] SLATER 1989).

NB: Reference books should be obtained from libraries prior to the field work.

2.3 Preparation

Groups are advised to visit the site at least one to two weeks prior to the field work and to plan all practicalities associated with the creek survey and the 12-hours long field study.

It cannot be stressed enough that field works require a very thorough preparation.

Surveys of the channel cross-section (Table 2-4) shall be conducted few days before the field trip at low tide during daytime, with all appropriate safety measures.

You will need to find the nearest permanent survey marker and its coordinate.

Get a pole/stick and equipment to install strongly a graduated pole/stick for water level readings during the field work. A photograph of the sturdy benchmark (BM) will be included in the report.

Each group must organise a heavy sledge hammer or star picket driver for driving in star pickets and bench mark. The pole/stick must be removed after field works (i.e. after 7:00am).

Prepare freshwater (if needed to dilute the brackish waters) for conductivity readings (1). Take a graduated bucket to dilute saltwater samples if necessary.

There is no freshwater available on site. Each group is strongly advise to bring large amounts of fresh/drinking water on site (e.g. 5 L container).

Deionised water is also required to wash the DO colorimetry kit equipment between each measurement.

Bring two buckets with a rope (for water collection from a platform and for fish trap/net observations).

Get at least one bucket with a lid (to carry samples for DO measurements).

Bring ropes, and relevant tools and equipments.

Some groups may need to bring a robust ladder to climb down the bank (without damaging it) at low tide.

Bring Waste Bottles for Water wastes. The bottle(s) must be clearly labelled WASTE.

Get bait for fish trap (for all the field work duration).

Get also clove oil to put to sleep exotic fish which are not to be released back to the eco-system.

Bring a waterproof stopwatch to record free-surface velocity.

Free-surface velocities are measured by timing suitable floats (e.g. branch) over a known distance.

Bring a camera and films.

Photographic evidence may be useful to support your report and presentation.

Bring permanent marker pens for relevant marking.

---

1The range of the conductivity meters is 0-20 μS. (Check units in the documentation.) The upper range is less than 50% of seawater conductivity.
Make up clear and waterproof log-in sheets for all the data recordings for all the day. Have a backup system. **Remember that the data set will constitute a substantial part of the report and assessment.**

Bring gum boots and fishing boots.

Bring any relevant equipment that may be needed. (For example, a ladder to climb down the river without damaging the banks.)

Be prepared for any type of weather (rain, sun, wind, ...).

Bring lights and torches to setup and pack up your site.

Bring binoculars for bird and wildlife watching. Each group must have a least one reference book [8,9] on bird and wildlife in South-East Queensland.

Each group must have at least one reference book on fish [12].

Do not forget sun screen, sun glasses, hat, gloves, insect repellent ....

A ladder may assist the access to the river bed (Sites 3 and 2B). The ladder should be secured with ropes to a solid place.

A ladder may be obtained from Mr Jason VAN DER GEVEL (UQ-CE Hydraulic Lab.) prior to the field work and should be returned together with the equipments after the field trip.
Alternately, Mr Jason VAN DER GEVEL (UQ-CE Hydraulic Lab.) could bring on site the ladder on Monday 3 September by 06:00 and collect it after 18:00 on the same day.

**In Addition**

You will need to find the nearest permanent survey marker and its coordinate.

Include photographs of the field works and of the permanent marker in your documentation.

Groups may consider obtaining aerial photographs.

Find relevant flood and hydrological studies of the area.

Photographs of flood events ...

Information on treatment plant operation

**2.4 Access**

Eprapah Creek is located in Victoria point. The sites 3, 3B and 4 are located in the Eprapah Environmental Training Centre (Fig. 1-1). Site 1 is in Point Halloran Environmental Park (Fig. 1-1). Sites 2, 2B and 2C are on the left bank (Fig. 1-2). Site St is accessible off Aspect Drive (Fig. 1-1).

+ By car, go to Victoria Point.

+ By train/bus: Go to Cleveland train station and take the bus to Victoria point.

+ All the sites are accessible on foot. (Be careful of flooding during rain storm periods and storm surges). During the survey and field works, be aware of local residents. Do not trespass on private properties. Be aware of the risk of bush fires.

  **Remark:** There is a shopping centre (incl. a Bi-Lo supermarket, a chemist) at the corner of Colburn Ave and Cleveland-Redland Bay Rd, Victoria Point.
2.5 Safety

Safety is uppermost important during all the field works.

Each student is asked to read the risk assessment for the field work:

Website: https://new.risk.admin.uq.edu.au
Task/Process: 35687 - Eprapah Creek - Day Trip

The risk assessment is compulsory reading. It is the responsibility of each individual to read it before the field work.

+ **Students will be working in groups of no less than 3 people at any time on site.**

+ Students shall have at least two mobile phones on site and switched ON at any time. Each group will provide the lecturer with two contact mobile phone numbers by Tuesday 10 August 2010. **These phone numbers shall be operational on Monday 3 September 2012 (5:00am) to Monday 3 September 2012 (7:00pm) at all times** and may be used by the Police, the Emergency Services, the Redland Shire Council and the University of Queensland in case of emergency (e.g. bushfire, storms).

**Do make sure that your batteries are charged. Take spare mobile phone batteries for emergencies.**

+ No work shall be attempted into water more than waist deep. Persons going into the water must wear a life line secured to the bank. Only confident swimmers are to do the work in the water.

+ Good common sense is recommended to avoid any injury: e.g., do not jump from walls, watch your steps.

+ It is strongly advised to wear adequate shoes or boots. Strong clothing is recommended, incl. shorts and trousers.

+ Hat, sunglasses and sun screen are strongly advised. Bring also mosquito/insect repellent.

+ During or immediately before the field works, DO NOT consume alcohol or other intoxicating substances.

+ Drive safely to and back from the field work.

**Contact phones**

A safety officer will be based in the Mungara building with a first aid kit, for the duration of the field works from 6:00am to 6:00pm. In emergency, he will be contactable at the following number:

Mobile Phone Number: **0448 055 011** SAFETY OFFICER (Jason VAN DER GEVEL)

For emergencies, dial 000.

<table>

<td>000 Emergency calls.</td>
</tr>
</tbody>
</table>

To get Cleveland Police Station (7-11 Middle St, Cleveland QLD 4163), dial (07) 3824 9333.

To get Brisbane Police Headquarters (200 Roma Street Brisbane QLD 4000), dial (07) 33 64 64 64.

Prof. Hubert CHANSON will be on site all the day and contactable at: 0422 652 248.

2.6 Environmental issues

All field works will be conducted in Conservation Parks and Environmental Centre. Staff and students are requested to take care to the environment during the field works.
+ All refuse and litter generated by the activity **MUST BE REMOVED** from the reserve areas.

Wastes must be removed.

+ Noise and disturbance associated with the field works must be kept at a level which has no negative impact upon the environment (e.g. birds, fish) and surrounding properties.

+ Damage to the banks is not acceptable.

+ Any damage attributable to the use of the reserves will be rectified at cost and the relevant group(s) shall be **heavily penalised**.

- No vehicles are to access the reserve area.

- During fish observations, exotic fish must not be released into the stream system. Place these in a bucket with few drops of clove oil to put these asleep. Later freeze them to kill them.

  - *When handling fish, use wet disposable gloves* (e.g. latex gloves) to handle the fish to avoid damaging their mucus. Fish mucus are very sensitive and dry skin may damage these.
3. Assignment

An estuary is a water body where the tide meets a river flow and where mixing of freshwater and seawater occurs. Estuaries may be classified as a function of the salinity distribution, and density stratification (CHANSON 2004b). That classification does not express however the unique feature of each estuary, and it does not account for seasonal changes, nor for differences between neap and spring tides. The study of mixing in estuary remains a complex process (IPPEN 1966, FISCHER et al. 1979, LEWIS 1997, CHANSON 2004a,b).

Eprapah Creek is a small system in the Redland Shire. The estuary was subjected few years ago to major pollution. The problem was dealt with. The estuarine zone is characterised by two environmental parks (Eprapah Environment Training Centre and Point Halloran Conservation Park), some marinas and boat yards, and a sewage plant.

</tbody>
</table>

Water quality and ecology are closely monitored at Eprapah Creek. For example, the Qld DERM-EPA Water Monitoring Group has been surveyed the water quality monthly for years, while Waterwatch and landcare groups regularly monitor aquatic and bird lives. This system and the interactions between hydraulic engineering, water quality and ecology are the topics of the advanced hydraulics field work of the CIVL4120 Advanced Hydraulics subject. Each group will produce (Table 2-4):

1- a detailed data set of hydraulic, water quality and ecological parameters monitored during a 12 hour period on Monday 3 September 2012 (6:00am) to Monday 3 September 2012 (6:00pm),
2- a comparison of these data with previous observations,
3- a surveyed cross-section of the estuary at the site listed in Table 2-4,
4- a hydraulic modelling of the whole estuarine system for a full day (Table 2-4) based upon St Venant equations, and
5- a complete analysis of the experimental and numerical data over a full tidal cycle, identifying clearly key features of the estuarine system, some obvious
6- recommendations for optimum environmental management of the system (this is not obvious and it requires an solid understanding of the local environment).

Notes
For the numerical modelling, each group will validate its model with the field data collected on Monday 3 September 2012. Then complete calculations (00:00 to 24:00) will be performed for another day (Table 2-4). For these calculations, it is essential that the freshwater flow from Eprapah Creek be estimated at the Redland Bay/Cleveland Road crossing for the period 1-4 September 2012.

Data analysis
The purpose of the numerical modelling is to assist with the data analysis. Once your hydrodynamic model is validated, you should use your results to discuss the interesting features that you observed on the Monday 3 September 2012. For example, the hydrodynamic model may provide some insights into the time-variations of conductivity and temperature during the field study.

The combination of field and numerical data is an unique approach that will allow you to gain a better understanding of the complete system. Herein the system is the Eprapah Creek estuarine zone that interacts with the Moreton Bay, Eprapah Creek riverine system (2).

You may wish also to discuss with the DERM expert on the estuarine system, its characteristics and its physio-chemical patterns.

2Remember to measure the freshwater inflow at the bridge beneath the Redland Bay to Cleveland Road on Monday 3 September 2012 and to get the rainfall record off the B.O.M. website.
4. Assessment

4.1 Presentation
The assessment of field works will take place as:
- a group work during the semester (35% of CIVL4120 subject), and
- some individual examination at the end of semester examination.

During the semester, the students will work in groups of 6-10 people. The groups will be finalised no later than Tuesday 21 August before 14:00. Three to six sites will be investigated at the locations listed in Table 1-1. This gives room for personal preference in the choice of group number (i.e. site number).

Each student has the responsibility to examine the list of sites (Table 1-1, Fig. 1-1 & 1-2), to find his/her preferred group and to sign up in this group. (The composition of a group shall remain un-changed after Tuesday 21 August before 14:00, unless exceptional considerations after discussion with and approval by Prof CHANSON.)

4.2 Assessment
The group work will be assessed as a combination of report submission and oral presentation. The group report will be assessed by the lecturer. The oral presentation will be assessed by the lecturer(s) and by the other groups.

</tr>
</thead>
<tbody>
<tr>
<td>Presentation (lecturers' assessment)</td>
<td>20%</td>
</tr>
<tr>
<td>Presentation (peers' assessment)</td>
<td>15%</td>
</tr>
</tbody>
</table>

4.3 Instructions for report submission
Each report will be assessed upon:
- the field data of the group including the creek cross-sectional survey (33%)
- the data quality and presentation (15%)
- the technical contents, accuracy and soundness, incl. the hydraulic modelling of estuary (37%)
- the presentation style (15%)

4.3.1 Report submission and instructions
For each group, three copies of the report & CD/DVD Rom must be submitted in person to Prof CHANSON by Thursday 20 Sept. 14:00. The report will be reviewed by the lecturers.

Note that the report submission deadline is after the oral presentation. This will give opportunity for each group to revise its report after the oral presentation based upon advice and comments received during the presentation. It is expected that each group will honestly acknowledge any advice received during the group presentation and discussion.

+ Page Limits
Each report must be complete within a limit of 20 pages including front page, table of contents, main text, figures and references, but excluding appendices and drawings attachments. Reports that exceed this limit will be penalised by 5% penalty per extra page. Shorter reports of significance will be given preferences.
Each report will be single-sided. Each page must be numbered. The text is to be single-spaced, 12 pt Times Roman or similar. The paper is to be printed on plain A4 size paper. The manuscripts must be typed within the area of 255 mm by 170 mm. With a normal A4 size paper, the distances between the edge of the sheet and the text become as follows:
- top: 2.0 cm
- bottom: 2.0 cm
- sides: 2.0 cm

+ Layout of Text
The front page must follow the template given in Appendix II. The report should contain as a minimum:
- the front page (see Appendix II), followed by
- a table of contents,
+ Figures and tables

Figures and tables must be placed in the text next to the first reference. These figures and tables would be referred to as "Figure 1" and "Table 1". Titles of figures and tables are to be in 12pt Times Roman.

+ Format for references

Reference should be listed at the end of the paper and should include the following information: Author's family name, Initials. : Paper title, Journal's title, Volume No., (year), pages.

For example:

+ Digital data

Each group is asked to submit 3 copies of CD/DVD containing all their data set in a digital form. Students should consider either or both digital formats CD-R and DVD+-R. (Only these formats shall be assessed.)

The CD-ROM/DVD-ROM will also include relevant photographs (JPEG format), some data analysis, the numerical modelling and a copy of the group report (e.g. PDF format).

The digital data must be properly presented. The material may be sub-divided into sub-directories while a text file, acting as map of the CD/DVD-ROM contents, must be placed of the top of the directory tree.

Note: Each group will record a lot of information, (1) on the field work period (3 September 2012), (2) during the surveying, and (3) with the hydraulic modelling . All the information needs to be recorded, including relevant handwritten comments, ... (The CD-ROM/DVD-ROM may include a scanned version of the handwritten log-in sheets, relevant photographs, tabulated data sheets, a copy of the report, ...)

The digital informations constitute an integral part of the report supporting material. They will be carefully scrutinised and assessed.

4.3.2 Deadlines

The group reports are due on Thursday 20 Sept. 2010 before 14:00. The reports must be submitted directly to Prof Hubert CHANSON who will write down, on the cover page, the submission date and time. (It is the responsibility of each group to find the lecturer and to hand him the report in person.)

Penalty for lateness are 5% per hour of lateness on Thursday 20 Sept. 2012 and 50% for submission on Friday 21 Sept.. Note that no report will be accepted after Friday 21 Sept. 8:00am.

4.4 Instruction for oral presentation

Presentations will take place on Tuesday 18 September 2012 between 12:00noon and 13:50 in Room 50-C406 (Civil Engineering Seminar Room). Each group will be given 15 minutes (maximum) for presentation followed by up to 8 minutes for discussion. Lecturers and fellow students will contribute to the discussion.

Groups may use Powerpoint presentations, overhead projector transparencies and/or slides. The Powerpoint files must be provided on a CD-ROM to Prof CHANSON no later than Tuesday 18 September 2010 8:30 am. Group presentations on pen disks/flash drives/USB devices shall not be accepted.
Each group is requested to provide 6 copies of their slides before Tuesday 18 September 2010 8:30am. These will be distributed to each group and lecturers prior to the start of the presentations.

Each presentation will be judged upon:
- the quality of the data set (15%),
- the technical content (30%)
- the presentation style (20%)
- the expertise and ability to answer questions during the discussion (35%)

Notes:
+ The presentations are limited to 15 minutes per group to allow some discussion. Groups which spend longer presentations times shall be penalised for the reduced duration of the discussion time.
+ Each group presentation will be assessed by both lecturers and student peers. Attendance to all the presentation is therefore compulsory.

4.5 Deadlines
Thursday 20 Sept. before 14:00
(in Prof CHANSON's hands)

Tuesday 18 Sept. between 12:00 and 13:50
Room 50-C406 (Civil Engineering Seminar Room)

Complete hydraulic design report
Penalty for lateness:
- 5% per hour of lateness on Thursday 20 Sept.
- 50% for submission on Friday 21 Sept. before 8:00am (or start of the first oral presentation)
- 100% penalty for submission after Friday 21 Sept. 8:00am

Group presentation
Penalty for lateness to start:
- Presentation time and marks reduced accordingly (e.g. 5 minutes lateness = only 18 minutes for presentation & discussion = 22% penalty)
- Presentation cancelled and zero marks for any group not ready 10 minutes after the official start time.

Penalty for lengthy discussion:
Presentation too long = less discussion time ⇒ discussion marks reduced accordingly (e.g. 17 presentation = only 6 minutes for discussion = 25% penalty on discussion marks)

Appendix I - Maps

I-1 Aerial photograph of Erapah Creek (Google Earth™)
I-2 The Eprapah Visitor's Map
I-3 Point Halloran Conservation park, Eprapah Creek, Redlands, Queensland (Site 1)

The Wet and Wild Walk is a 650m circuit that returns to the car park. Allow yourself time to read the self-guiding signs and to discover what Point Halloran has to offer. As you continue along this walk you may be surprised by the changing vegetation types and variety of animals that call Point Halloran their home.

This walk is suitable for wheelchairs in dry conditions.
