DIGITAL APPENDIX. PHOTOGRAPHS OF UPSTREAM BORE PROPAGATION

The digital appendix was developed to illustrate photographic sequences of upstream bore propagation. The appendix documents two cases: a breaking bore (Fig. II-1) and an undular bore (Fig. II-2). In each case, the bore propagates from left to right and the time interval between each photograph is 0.12 s. The photographs were taken with a dSLR camera Pentax™ K-3.
